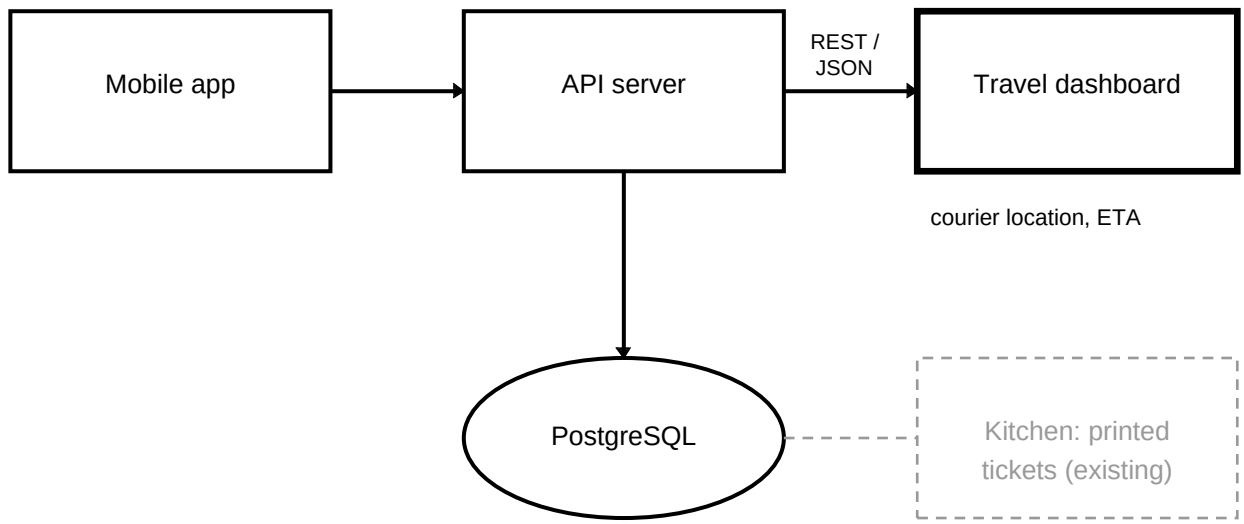
Mobile ordering app - pilot update

We ran the ordering system with two restaurants for a month. Most orders turned out to be deliveries. The kitchen staff are happy with the printed order tickets from their existing till, so they don't want another screen in the kitchen for now.


What the operations team is missing is a view of orders after they leave the restaurant: which courier has each order, where it is on the way, and the expected arrival time. They want to see all trips on one screen and spot late deliveries. See the updated sketch below.
